Abstract

The General Data Protection Regulation (GDPR) replaced the old and battered Data Protection Directive on 25 May 2018 after a long-drawn reform. The rapidly evolving technological landscape will test the ability of the GDPR to effectively achieve the goals of protecting personal data and free movement of data. This thesis proposes a technological supplement to achieve the goal of data protection as enshrined in the GDPR. The proposal comes in the form of digital identity management platforms built on blockchain technology. Such digital identity management platforms enhance the personal autonomy and control of individuals over their identities. This is important in light of heightened profiling activity. However, the very structure of blockchain poses some significant challenges in terms of compatibility with the GDPR. In light of these challenges, the claim of GDPR being a technologically neutral legislation is analysed. Further, the thesis attempts to assess compatibility issues of a blockchain based digital identity management solution on the parameters of data protection principles like accountability, data minimisation, control and data protection by design in conjunction with the right to be forgotten and right to data portability.
